

*A hint from us to you for the care and maintenance of your Spa Cover:*

Maintain good water chemistry. Have your water balanced by a professional spa dealer periodically. Harsh water conditions can eat away at the materials of your cover. Wait 30-45 minutes after adding chemicals to your spa before putting the cover back on – this will allow fumes to disperse.

Handle your cover with care – dropping the cover, especially on the corners, can cause foam breakage.

A good brushing and hose-down will suffice between cleanings, but covers should be cleaned thoroughly at least twice a year.

To clean the outside, use a mild dishwashing soap or specialty spa-cover cleaning products, rinse and let dry thoroughly. A conditioning product designed specifically for vinyl covers can then be applied to soften and protect the cover material.

To clean the inside, unzip the cover and remove the foam cores. Scrub them and the cover's insides with mild soap or special cleaner, rinse and allow to dry thoroughly before reassembling. Do not leave the foam cores in direct sunlight – they may melt.

When reassembling the cover, flip over the foam cores. Snow, rain and regular wear can cause covers to sag and collect water, and the weight of this water magnifies the sagging problem. Heavy snow should be brushed off the cover and not allowed to accumulate. Flipping the foam twice a year to be convex will make the water run right off, thereby lengthening the life of the cover considerably.

A thermal spa blanket can be placed on the water's surface to assist with heat retention and protect the underside of the spa cover.
